

Claims: 1.
vehicle

with a stationary turnably borne winding shaft (8),
with a blind material (12) which has two edges (33)
parallel to one another, and which is extractable through an
outlet slot(7),

with a pull rod (13) which is fastened to the other edge
(33) of the blind material (12),

with two guide elements (41) spaced from one another which, in the reeling-out, serve to guide the pullrod (13) on the window pane (4), and which by means of bearing arrangements (42, 62) are movably borne on the pullrod (13) in such manner that between a first position and a second position they are movable back and forth, in which in the first position they are retracted with respect to the circumferential contour of the pullrod (13) and in the other position they project for a

1. The first of these is the fact that the

distance beyond the circumferential contour of the pullrod (13) in order to hold them spaced from the window pane (5) in the reeling-out.

5 2. Roll-up window blind according to claim 1, characterized in that the winding shaft (8) is borne in a housing which has the outlet slot (7) for the blind material.

10 3. Roll-up window blind according to claim 1, characterized in that the housing is installed into a hat deposit area (6) of the motor vehicle.

15 4. Roll-up window blind according to claim 1, characterized in that the run-out slot (7) is contained in a hat deposit area (6) of the motor vehicle.

20 5. Roll-up window blind according to claim 1, characterized in that the drive arrangement is a spring motor which is located inside the winding shaft (8).

25 6. Roll-up window blind according to claim 1, characterized in that the pullrod (13) and the run-out slot (7) are attuned to one another in their shape, in such manner that, with reeled-in blind material (12) the pullrod (13) closes the run out slot (7) except for an annular gap surrounding the pullrod (13).

7. Roll-up window blind according to claim 1,
characterized in that the pullrod (13) and the run-out slot (7)
are attuned to one another in their shape in such manner that
the pullrod (13), with reeled-in blind material (12), covers
5 the running-out slot (7).

8. Roll-up window blind according to claim 1,
characterized in that as actuating elements (9, 11) there are
provided two actuating levers swingably borne beside the
10 winding shaft (8) which, with their free ends cooperate with
the pullrod (13) and are swingable out of a position in which
they run about parallel to the winding shaft (8) into a
position in which they are about at a right angle to the
winding shaft (8).

9. Roll-up window blind according to claim 1,
characterized in that the guide elements (41) are slide skids.

10. Roll-up window blind according to claim 1,
20 characterized in that the guide elements (41) are rotatable
rollers.

11. Roll-up window blind according to claim 1,
characterized in that the bearing arrangement (42) has a
25 slide-block guide (44).

12. Roll-up window blind according to claim 1,

characterized in that the side-block guide has a curved guide slot (44) with which the guide element (41) is led along a path.

5 13. Roll-up window blind according to claim 1, characterized in that the guide slot (44) is curved in sector form.

10 14. Roll-up window blind according to claim 1, characterized in that the guide slot (44) has an L-shaped course.

15 15. Roll-up window blind according to claim 1, characterized in that the bearing arrangement (42) has a bearing carrier (62) swingable about an axis (63).

20 16. Roll-up window blind according to claim 15, characterized in that the axis (63) runs at least approximately parallel to a plane that is defined by the spread blind material (12).

25 17. Roll-up window blind according to claim 16, characterized in that the axis (63) runs at a right angle to the pullrod (13).

 18. Roll-up window blind according to claim 1, characterized in that to the guide element (41) there is assigned a pre-stressing device (52) with which the guide

element (41) is prestressed indirectly or directly in the direction toward the protruding position.

19. Roll-up window blind according to claim 1,
5 characterized in that to the bearing arrangement (62) there is allocated a pre-stressing arrangement (65), with which the bearing arrangement (62) is pre-stressed either directly or indirectly in the direction toward the protruding position.

10 20. Roll-up window blind according to claim 1, characterized in that the pre-stressing device (52) has a bending spring.

15 21. Roll-up window blind according to claim 1, characterized in that the path along which the guide element (41) is movable back and forth curves about an axis which lies parallel to the longitudinal extent of the pullrod (13).
